AB	Improved structural and other composite materials were developed which have desirable performance properties, including high compressive strength, high tensile strength, high shear strength, and high strength-to-weight ratio. The materials have the added benefits of ease of manufacture, and are inexpensive to manufacture. A variety of substances can be applied to the materials without melting, dissolving or degrading the basic structure. This facilitates bonding the materials to virtually any surface or substrate. Also, the bond between the materials and a variety of substrates is exceptionally strong, rendering the resulting bonded article suitable for use in a variety of demanding applications. The materials can be manufactured in a wide variety of sizes, shapes, densities, in multiple layers, and the like; and the performance properties can be evaluated in a variety of ways. An interpenetrating polymer network of polystyrene and an ethylene vinyl acetate copolymer (Arcel), and a polyurethane polymer matrix, was employed to generate a surfboard core structure that is both lightwt. and strong.

AB A reactive liquid crosslinking agent for use in the preparation of polymeric substances. The crosslinking agent comprises a substituted 1,3,5-triazine reacted with H₂O, an acid alkyl sulfonate and/or phosphonate and a solidifying modifier containing an hydroxyl functional group to form a substituted 1,3,5-triazine hydrate. The reactive liquid polymer crosslinking agent has a solids content between 20-99% solids. The reactive liquid crosslinking agents (RLPC's) are useful as modifiers in the preparation of polymeric compds. which are suitable for 1-component self-crosslinking adhesives, coatings and polymers used in optics, textiles, composites, casting and molding. RLPC systems containing from 1-30% RLPC provide fast single package thermosetting polymeric compds. with

enhanced properties such as chemical, heat and abrasion resistance.

AB A **resin** composition comprising a 2-(1-arylalkylidene) acetic ester
 and at least one **resin** selected from a Me methacrylate
resin, a styrene **resin** and a Me methacrylate-styrene
 copolymer **resin** is provided, wherein the acetic ester is
 contained in the composition in an amount of from about 0.0005 part by weight

to
 about 0.1 part by weight with respect to 100 parts by weight of the
resin. The **resin** composition is improved in durability
 without deteriorating the excellent properties of the **resin**,
 such as being colorless and transparent. Thus, Me acrylate-Me
 methacrylate copolymer 100 and 2-ethylhexyl 2-
 (paramethoxybenzylidene)acetate 0.003 part were extruded to give a molding
 sample showing good transparency.

AB A device for depositing a transfer material onto a receiving substrate includes a source of pulsed laser energy, a receiving substrate, and a target substrate, which comprises a laser transparent support having a back and a front surface. The front surface has a coating comprising a mixture of the transfer material, and a matrix material having the property that, when it is exposed to pulsed laser energy, it is more volatile than the transfer material. The pulsed laser is positioned relative to the target substrate, so sufficient pulsed laser energy is directed through the back of the laser-transparent support to strike the coating at a defined location to volatilize the matrix material, causing the coating to desorb from the location and be lifted off the support. The receiving substrate is positioned spaced from the target substrate, so transfer material in the desorbed coating can be deposited at a defined location on the receiving substrate. This process uses laser-positioning means, target substrate positioning means and receiving substrate positioning means.

 DT Journal
 LA English
 AB Fifteen neg. and 4 pos. resists were tested to determine their proton-beam sensitivity and contrast. The ratio of the required 20-keV electron dose (QE) to the required 100-keV proton dose (Qp) ranged from a low value of 7.8 to a high value of 270. A plot of log QE as a function of log Qp is roughly linear and suggests that the advantage of proton beams generally diminishes as the sensitivity of the resist increases. For comparing neg.

resists, the most meaningful figure of merit is the product of Qp and the weight-average mol. weight (.hivin.Mw). This product was almost constant for a series

of narrow dispersivity polystyrenes over the .hivin.Mw range of 20,000 to 2,600,000.

AB Modified polyesters and polycondensation products having increased dye affinity are prepared from unsatd. carboxylic acids and acrylic polymers. Me methacrylate is polymerized in solution with Bz2O2 as catalyst and AcOH as solvent. Similarly, copolymers of Me acrylate and styrene are prepared by using CCl4 and dioxane as solvents. For example, a mixture of di-Me terephthalate, ethylene glycol, Zn(OAc)2, and Sb2O3 was heated for 3 hrs. at 170-190° and for 0.5 hr. at 240-50° in the presence of N. A homopolymer or copolymers were added and heated in vacuo at 260-80° for 0.5 hr. and at 1 mm. for 6 hrs. A polyester containing 80% and 20% (Me acrylate gives a clear solution of poly(ethylene terephthalate). This polyester material, when heated for 2 hrs. at 98° in a dispersed dye aqueous solution containing an acrylic or methacrylic ester, dyes a deep shade which is resistant to light.
